# How does a web app work? What does Flask do?

Flask is a Python microframework for building web applications.

## Server (back-end)

- Python
- Flask runs here
- Computes and serves HTML to front-end

HTTP Methods GET, POST, etc.

## Web browser (front-end)

- HTML, CSS, JavaScript
- Rendered by the browser

### Introduction

Summary

Resources

- Install Python if you haven't already: [python.org](https://python.org)
  - I'm using 2.7, Flask also supports 3.3+
- Install Flask using PIP
  - **Pip** Installs **P**ackages from the **P**ython **P**ackage **I**ndex  
a.k.a. PyPI

## Flask Installation

```
> sudo pip install Flask
```

# Editing

An IDE is overkill for this workshop. Use a programmer's editor that you're comfortable with:

- Vim (All platforms)
- Atom (All platforms)
- Visual Studio Code (All platforms)
- Sublime Text (All platforms)
- Notepad++ (Windows)
- TextMate (OSX)
- Whatever floats your boat

# Debugging

You'll be testing and debugging your code from the browser, so use one with good developer tools:

- Chrome
- Firefox

Other browsers can be used, but Chrome or Firefox will minimize the chance of running into browser specific issues.

# Hello World

(Open up your editor and follow along!)

# Super basic hello world example

This is the bare minimum code needed on the back-end to serve a web page

```
./code/hello_world_example/hello_world.py
```

```
from flask import Flask
app = Flask(__name__)

@app.route("/")
def hello():
    return "Hello World!"

if __name__ == "__main__":
    app.run()
```

# Running the web app

Once we've written the flask code, we can run the server locally and view the results in our web browser

Execute these commands to run the code:

```
> cd /directory/with/project  
> export FLASK_APP=hello_world.py  
> flask run
```

Then you'll see something like:

```
* Serving Flask app "hello_world"  
* Running on http://127.0.0.1:5000/  
(Press CTRL+C to quit)
```

- 4 The `hello()` method in `hello_world.py` was executed and the return value is sent to the browser as HTML
- 5 The browser received the HTML and rendered the webpage

# Interactive hello world with variable routing

Now that we have a basic idea of how flask works, we can do some cool stuff with routing:

```
./code/hello_world_example/hello_user.py
```

```
from flask import Flask
app = Flask(__name__)

@app.route("/world")
def hello():
    return "Hello World!"

@app.route("/user/<name>")
def hello_user(name):
    return "Hello %s, how are you today?" % name

if __name__ == "__main__":
    app.run()
```

# Hypertext Transfer Protocol

*The data transfer protocol used on the World Wide Web*

**GET** The most common HTTP method, used to get files from a server. Multiple GET requests are made by your browser every time you visit a webpage to retrieve all the necessary resources needed to render that page, such as HTML files, CSS and JavaScript files, images, etc.

**POST** This method is used to send data to a server. Commonly used to submit form data or any other user input.

These are the most common HTTP request methods and the ones used by the demo, others exist:

# Putting It All Together (part 2)

*Send data to the server, back-end computation, return results*

- 1 User enters information into the input fields and clicks the Sort button
- 2 The JavaScript function bound to that button is invoked
- 3 The input information is read from the input fields and stored in an object (**JavaScript Object Notation**)
- 4 A PUT request is created and sent to `"/sort"`
- 5 Flask server receives the request
  - 1 The method bound to `"/sort"` is invoked
  - 2 The data from the request object is accessed
  - 3 The list is sorted

# Putting It All Together (part 2)

*Send data to the server, back-end computation, return results*

- ① User enters information into the input fields and clicks the Sort button
- ② The JavaScript function bound to that button is invoked
- ③ The input information is read from the input fields and stored in an object (**JavaScript Object Notation**)
- ④ A PUT request is created and sent to `"/sort"`
- ⑤ Flask server receives the request
  - ① The method bound to `"/sort"` is invoked
  - ② The data from the request object is accessed
  - ③ The list is sorted
  - ④ A response object is created with the results in JSON format and returned

**Summary**  
Resources

- Setting up a development environment for Flask
- Basic & and variable routing
- GET and POST requests
- Accessing request data
- Overview of in-browser developer tools
- Building and serving a “complex” web app with HTML, CSS, JavaScript and Python

# Next Steps

## Deep Dive

## Conclusion

Summary  
Resources

## More Flask Features

- URL Building
- Additional HTTP Methods
- HTML templates with placeholders, complex templating language
- File uploads
- Reading and writing cookies
- Redirects and error handling
- Managing sessions
- And lots of other stuff

The Flask website and documentation is really good! Lots of great tutorials exist, just search around.

# Deploying your web app

Once you've developed and tested you app locally, you can deploy your code and make it publicly accessible. There lots of tutorials on how to do this for various cloud providers (AWS, Azure, DigitalOcean, etc).
